## Machine Learning Exercise Sheet 10

## **Deep Learning II**

## Homework

**Problem 1:** You are trying to solve a regression task and you want to choose between two approaches:

- 1. A simple linear regression model.
- 2. A feed forward neural network  $f_{\mathbf{W}}(\mathbf{x})$  with L hidden layers, where each hidden layer  $l \in \{1, ..., L\}$  has a weight matrix  $\mathbf{W}_l \in \mathbb{R}^{D \times D}$  and a ReLU activation function. The output layer has a weight matrix  $\mathbf{W}_{L+1} \in \mathbb{R}^{D \times 1}$  and no activation function.

In both models, there are no bias terms.

Your dataset  $\mathcal{D}$  contains data points with nonnegative features  $x_i$  and the target  $y_i$  is continuous:

$$\mathcal{D} = \{\boldsymbol{x}_i, y_i\}_{i=1}^N, \quad \boldsymbol{x}_i \in \mathbb{R}_{>0}^D, \quad y_i \in \mathbb{R}$$

Let  $\boldsymbol{w}_{LS}^* \in \mathbb{R}^D$  be the optimal weights for the linear regression model corresponding to a *global* minimum of the following least squares optimization problem:

$$\boldsymbol{w}_{LS}^* = \operatorname*{arg\,min}_{\boldsymbol{w} \in \mathbb{R}^D} \mathcal{L}_{LS}(\boldsymbol{w}) = \operatorname*{arg\,min}_{\boldsymbol{w} \in \mathbb{R}^D} \frac{1}{2} \sum_{i=1}^N (\boldsymbol{w}^T \boldsymbol{x}_i - y_i)^2$$

Let  $W_{NN}^* = \{W_1^*, \dots, W_{L+1}^*\}$  be the optimal weights for the neural network corresponding to a *global* minimum of the following optimization problem:

$$W_{NN}^* = \underset{\boldsymbol{W}}{\operatorname{arg min}} \mathcal{L}_{NN}(\boldsymbol{W}) = \underset{\boldsymbol{W}}{\operatorname{arg min}} \frac{1}{2} \sum_{i=1}^{N} (f_{\boldsymbol{W}}(\boldsymbol{x}_i) - y_i)^2$$

a) Assume that the optimal  $\boldsymbol{W}_{NN}^*$  you obtain are non-negative.

What will the relation  $(<, \leq, =, \geq, >)$  between the neural network loss  $\mathcal{L}_{NN}(\boldsymbol{W}_{NN}^*)$  and the linear regression loss  $\mathcal{L}_{LS}(\boldsymbol{w}_{LS}^*)$  be? Provide a mathematical argument to justify your answer.

Note that for any non-negative x and any non-negative W it holds ReLU(xW) = xW.

Therefore, since our data points have non-negative features  $x_i$  and the optimal weights  $W_{NN}^*$  are non-negative, every ReLU layer is equivalent to a linear layer when plugging in the optimal

weights. This means we can write

$$f_{\boldsymbol{W_{NN}^*}}(\boldsymbol{x}_i) = ReLU(ReLU(ReLU(\boldsymbol{x}_i^T\boldsymbol{W}_1^*)\boldsymbol{W}_2^*) \cdots \boldsymbol{W}_L^*)\boldsymbol{W}_{L+1}^*$$

$$= \boldsymbol{x}_i^T\boldsymbol{W}_1^*\boldsymbol{W}_2^* \cdots \boldsymbol{W}_{L+1}^*$$

$$= \boldsymbol{x}_i^T\boldsymbol{w}_{NN}^*$$

where we defined  $\boldsymbol{w}_{NN}^* = \boldsymbol{W}_1^* \boldsymbol{W}_2^* \cdots \boldsymbol{W}_{L+1}^*$ . From this we can see that the neural network with optimal weights behaves like a linear regression with a different set of weights  $\boldsymbol{w}_{NN}^*$ .

Note also that linear regression is a special case of the above neural network, i.e. for any weights  $\mathbf{w}_{LS}$  you can find weights  $\mathbf{W}_{NN}$  that produce the same output.

Given the above facts and since we the optimal weights correspond to a global minima we can conclude that  $\mathcal{L}_{NN}(\mathbf{W}_{NN}^*) = \mathcal{L}_{LS}(\mathbf{w}_{LS}^*)$  and the optimal weights found by solving the least squares optimization problem will be  $\mathbf{w}_{LS}^* = \mathbf{w}_{NN}^*$ .

b) In contrast to (a), now assume that the optimal weights  $\boldsymbol{w}_{LS}^*$  you obtain are non-negative. What will the relation  $(<, \leq, =, \geq, >)$  between the linear regression loss  $\mathcal{L}_{LS}(\boldsymbol{w}_{LS}^*)$  and the neural network loss  $\mathcal{L}_{NN}(\boldsymbol{W}_{NN}^*)$  be? Provide a mathematical argument to justify your answer.

As stated in (a) linear regression is a special case of the above neural network, i.e. for any weights  $\mathbf{w}_{LS}$  you can find weights  $\mathbf{w}_{NN}$  that produce the same output. That is, everything that can be learned with a linear regression can be learned equally well with a neural network.

However, the reverse direction doesn't hold, since in principle neural networks can learn more complicated functions compared to linear regression. Moreover, the given fact that  $\boldsymbol{w}_{LS}^*$  are non-negative does not tell us anything about the optimal weights of the neural network  $\boldsymbol{W}_{NN}^*$ .

Therefore it holds  $\mathcal{L}_{NN}(\mathbf{W}_{NN}^*) \leq \mathcal{L}_{LS}(\mathbf{w}_{LS}^*)$  since the neural network can potentially find a better fit for the data (e.g. by taking advantage of non-linearity).

**Problem 2:** Download the notebook exercise\_10\_notebook.ipynb from Piazza. Fill in the missing code and run the notebook. Convert the evaluated notebook to pdf and add it to the printout of your homework.

This week's programming assignment is closely related to the contents of the in-class exercises. Make sure that you have a look at the in-class exercises before starting to work on the homework task.

The solution notebook is uploaded on Piazza.

## **In-class Exercises**

**Problem 3:** See notebook exercise\_10\_pytorch.ipynb on Piazza.
